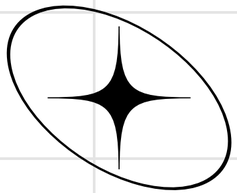
@NOVADESIGNS



CSS POSITION IS EASY

CSS (Cascading Style Sheets) position is a property used to specify how an element is positioned in a document.

NOVADESIGNS

STATIC

This is the default value. Elements are positioned according to the normal document flow.

DIV

Button

Click Me

Heading 1
Heading 2
Heading 3
Heading 4
Heading 5
Heading 6

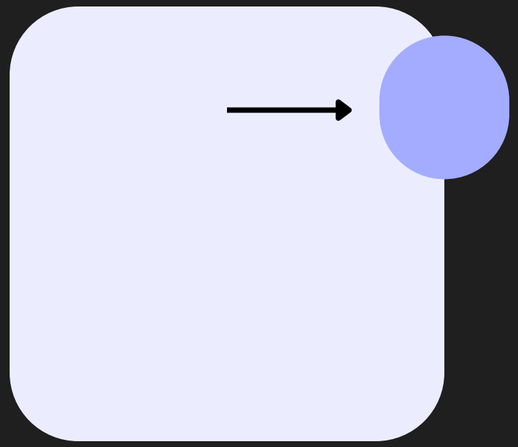
span

paragraph

image

RELATIVE

The element is positioned relative to its normal position. Shifting it does not affect the layout of other elements.



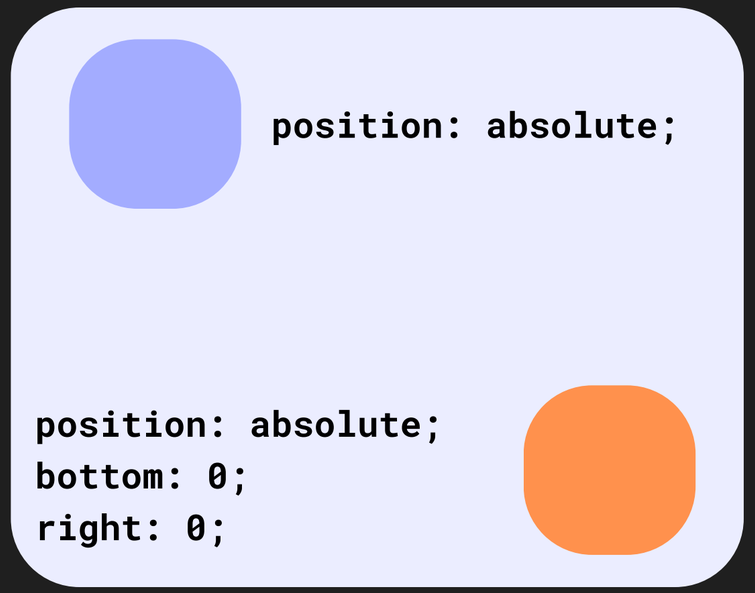
```
position: relative;
right: -15px
```

`right: 100%`

`right: 0%`

ABSOLUTE

The element is **positioned relative** to its **nearest positioned ancestor** (an ancestor with a position other than static). If there is no such ancestor, it uses the document body, and moves along with page scrolling.



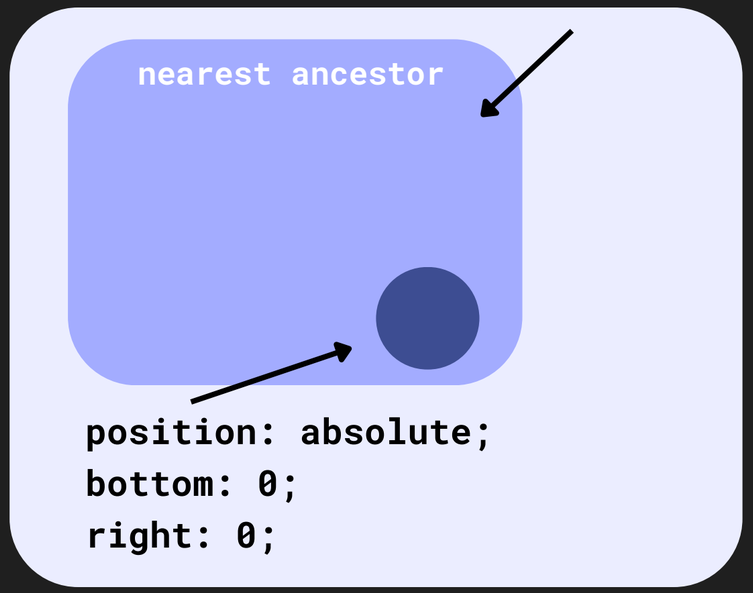
bottom: 100%;

bottom: 0;

right: 100%

right: 0%;

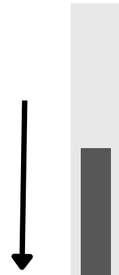
position: relative;



FIXED

The element is positioned relative to the viewport, which means it stays in place even when the page is scrolled.

STAYS AT THE SAME PLACE ON SCREEN
(EVEN WHEN SCROLLED)



STICKY

The element is treated as relative until it reaches a defined scroll position, then it is treated as fixed.
